

Sync dedicated MobileGym: per-turn PRM + ORM | job 3311023

■ solo-active: exactly one selected stage active ■ stage inactive / lane-local bubble ■ global: no selected stage span observed
▨ overlapped: ≥2 selected stages active ■ diagnostic WIP/wait lane (not in active-set count)

Solo-active wall time is an observed exposure candidate, not causal critical-path attribution. Reward is request WIP (queue + HTTP + client overhead), not GPU compute; transfer-buffer/data waits are excluded. Session-gate/admission wait is diagnostic residence, not execution. R0→R2 includes every observed physical span in the window, including step-0 warmup spill; measured lineage is steps 1 and 2. Global bubble is not system idle because environment execution lacks a leaf span.
